

## Chalets Lachat, Saint Martin de Belleville

We were involved with the design of three chalets in La Chat in France, all built on a steeply sloping mountain site. As part of our appointment, we worked closely with the Architect, Contractor, Pile Designer and Timber framing designer to develop a strategy to overcome difficult site and level conditions and challenging architectural proposals.

GCA led the coordination of the project to resolve several complex interfaces.

One key part of our appointment was the design and co-ordination of the foundations and walls, where we had to ensure that the complex requirements of the scheme were communicated clearly.

As with this case study, we feel that your project will benefit from our experience with addressing both buildability and sequencing as part of the design.

We would seek the input of all parties as soon as possible to predict the challenges that will be faced before the project comes to site.
